

The image displays the SteamVR Performance Test interface. On the left, a large white text asks "Is your PC VR Ready?" and "Find out now using the SteamVR Performance Test". In the center, a black silhouette of a person wearing a VR headset is shown in a dynamic pose. On the right, a dark grey panel shows the test results. At the top, a progress bar indicates the system is "VR Ready" (green), with "Not Ready" (red) and "Capable" (yellow) also shown. Below this, the "System Specs" are listed: OS: Windows 7 Service Pack 1, GPU: NVIDIA GeForce GTX 980 Ti, and CPU: Intel(R) Core(TM) i7-5930K CPU @ 3.50GHz (12 cores). The "Results" section states: "Your system is performing well above what is needed for recommended, high fidelity VR. Most VR titles have been tuned to run smoothly at the recommended visual fidelity. Others may opt to display with improved visual fidelity to support your extra power. Please note, your system's USB capabilities have not been evaluated. Follow the recommended specs for each VR headset." Below this, a "Fidelity" graph shows a blue line at the "Very High" level. At the bottom, a summary table shows: Average Fidelity: 10.6 (Very High), Frames Tested: 10990, Frames Below 90 fps: 0 (0%), and Frames CPU Bound: 0 (0%).

About This Software

The SteamVR Performance Test measures your system's rendering power using a 2-minute sequence from Valves Aperture Robot Repair VR demo. After collecting the data it determines whether your system is capable of running VR content at 90fps and whether VR content can tune the visual fidelity up to the recommended level. For machines that are not VR Ready the tool can help determine whether capabilities are bound by Graphics Card, CPU, or both.

Title: SteamVR Performance Test

Genre: Utilities

Developer:

Valve

Release Date: 22 Feb, 2016

b4d347fde0

English,French,German,Bulgarian,Dutch,Greek,Hungarian,Japanese,Polish,Romanian,Russian,Simplified Chinese,Swedish,Traditional Chinese,Turkish,Ukrainian

needs to get geared up for VR

SteamVR Performance Test Results

Not VR Ready

Not Ready Capable Ready

System Specs

OS: Windows 7 Service Pack 1
GPU: AMD Radeon(TM) R7 360 Series
CPU: Intel(R) Core(TM) i7-5930K CPU @ 3.50GHz (12 cores)

Results

Your system isn't capable of rendering low fidelity VR and it appears to be mostly bound by its GPU.
We recommend upgrading your Graphics Card.
You can also try updating your Graphics Card drivers, closing performance-heavy applications, and running this test again.

Fidelity

Very High
High
Medium
Low

Average Fidelity: 0 (Low)
Frames Tested: 6861
Frames Below 90 fps: 6477 (94.4%)
Frames CPU Bound: 0 (0%)

My bank did the same test, with different result... I guess I'll wait then. amazing and dramatic storyline 10/10. Tester does not see my NVIDIA card, only focuses on the onboard INTEL GPU. Need an option to select which VIDEO CARD to use. As a result, test is not accurate and will not advise correct information for my system!!!!. No replay value after receiving the "good" ending. Picked up my Integrated Graphics instead of my Graphics Card

Proceeded to watch for my entertainment

Finished test

Said that my System is "VR Ready"

Retook with my GPU

Said that my System is barely "VR Ready"

Proceeded to roll on the floor laughing

In Conclusion,

My intergrated Graphics is better than my GPU

10/10 Would Recommend

I downloaded the software and it said my computer was not VR ready. I have a gaming laptop with an intel I7, 16 gigs of RAM, and a GTX 960m (the laptop version of a GTX 960). I got an HTC Vive and tried it on my laptop, and while some of the more graphically demanding games don't work, most of them do. I have done google earth vr, universe sandbox, zombie training simulator, irrational exuberance, and others. Although the framerate is sometimes not the best, I haven't really had much of a problem with motion sickness, and it has not subtracted from the experience significantly. So while it is not the best for VR, it still works. I hope this helps anyone thinking about getting a vive.

If I could vote in the middle of "yes" and "no" on this, I would, because it said that it was using my intel graphics card and not my NVIDIA to do the test. But according to other posts, it actually IS using my NVIDIA but just not telling me it is?? That is one problem I would say the developers must work out.. Checking to see the results of this thing was the hardest 5 mins of my life, i swear.

After getting everything for christmas or paying my own money, it comes down to a single test.

And i passed with FLYING colors! 8.1 (Very High) score!

Using:

Windows 10 64-bit

NVIDIA GTX 1060 6Gb

AMD FX-6300 Six-core (I had to cut the budget somewhere)

Now all i need is the darn \$800 headset.... OS: Ready

Graphics Card: Ready

Processor: Ready

I am so happy now ,year!

HTC:Hey!This product is priced at 7000 yuan!!

Wallet: Not Ready

.....

. literally does not start. My computer is somewhat ready. My checking account is not. Plus, my mom said no more toys until I clean my room. I reminded her that I'm 44 and don't live at home anymore. She grounded me. When I finally get my VR system, I'm going to be the coolest guy in town. Girls will be beating down my front door. That'll show my mom that I was right all along.

Now I'm going to clean my room to be able to take advantage of room-scale VR, NOT because my mom said so. I mean it. I'm my own man now, and I don't care what my mom says.

*Mama, if you read this, I was hacked by the Russians. They're everywhere, Mama. Will you make me some grits and eggs?
Thanks. I love you!
